I've found two wireframe tools online. The first one is photoshop and another one is MockingBird.

For the photoshop, it doesn't offer libraries of interface elements, but for straight-forward, fast wireframing, it is a very easy choice for designers. However, it is too expensive for me, so i did not choose it for my final wireframe design.

For the Mockingbird, it is a web-based beta software based on the framework to create, link together, preview and share wireframes of the website. It has a clean and understandable interface. I just drag and drop UI. And Mockingbird is free, thats also one of the reason I chose it for my final wireframe design.
